

MOST OF MY CAREER PATH IS SOMEHOW VERY RELEVANT TO WHAT YOU NEED:

A ROOKIE, WHO DOESN'T NEED MICROMANAGEMENT AND SAW FINANCES FROM INSIDE

CAREER PATH

RELEVANT EXPERIENCE

Integrations Specialist

Planhat · 2026 – now

Agentic Customer Platform (CRM/CSP) used by leading SaaS and enterprise companies to run customer success and revenue operations.
Clients run Planhat inside a wide SaaS ecosystem, I help with their integrations

Startup Founder

priroda.tech · 2025 – now

Digital operations system for the flower shops business.
Commercial product for florist shops in Spain addressing new tax compliance requirements (Verifactu).

Freelance Product Builder

2024 – 2025 (2 yrs)

Several assignments for different clients.
Tax Advisory CRM, E-commerce Commissions, Sports League App, Casino Metrics, Gen-AI Pipeline.

Lead Product Owner

Boosta · 2023 – 2024

EdTech tutoring and ghost-writing services portfolio targeting Tier 1 country students.
Reduced cycle time (4 months→6 weeks) for new products and major feature releases.

Product Manager

Takeoff Technologies · 2019 – 2023

Software-and-hardware solution for grocery retailers to speed up online order fulfillment.
Led product scalability initiatives in e-grocery automation (B2B SaaS).

Lead Business Analyst

Eleks (Kernel) · 2017 – 2019

Comprehensive ERP solution for an agricultural company managing crop fields and machinery.
Managed the scope and overall logic of the ERP system for 50,000 field operations.

Operational Business Consultant

EY Business Consulting · 2011 – 2016

IT systems design, process optimization, and KPI development across corporate, government, and industrial sectors.
Different projects across Ukraine and Kazakhstan.

TECHNICAL IMPLEMENTATION

Can write, deploy, test, monitor, and be responsible for the solution. I don't need your engineering resources

- Goal - keep integration data reliable across a large, heterogeneous SaaS estate. I own integration reliability across 100+ repos (microservices), GCP infrastructure, multiple BigQuery instances, 3 databases, and ~500 client accounts, and built a proactive error-monitoring tool plus an AI Formulas Builder. Result: dozens of tickets avoided and hundreds of engineering hours saved per month.
- Goal - build a digital operations product for Spanish flower shops from scratch. I built the backend (Python + React), database, auth, multi-tenancy, payment integration, Verifactu tax-authority reporting, and a production iOS app, with e-commerce connectors and Railway/Vercel deployment. Result: a production iOS app live with 2 paying clients in Spain.

PROCESS IMPROVEMENT & AUTOMATION

10+ years ago I was teaching CEOs how to do that

- Goal - fix a 4-month release cycle on new landing site caused by overlapping team structures and a bloated backlog across 3 product brands. I formed 3 scrum teams with clear scope, closed or reorganized 1,000+ Jira tickets, and built a unified roadmap. Result: release cycle cut to 6 weeks (~3x faster).
- Goal - fix a 3-month retailer onboarding bottleneck caused by scattered configuration and manual access setup. I centralized 500 settings into self-service configuration, added SSO, and built monitoring tooling. Result: onboarding cut to 3–4 weeks, later to days (3–5x faster).
- I had several projects with banks in Ukraine and Kazakhstan — Prominvestbank (Ukraine), and VTB Bank and Casanova (Kazakhstan). Goal - strengthen core banking operations across risk, treasury, and reporting. I redesigned processes for risk assessment, cash and operations, and administrative/treasury management, and built the managerial reporting pipeline end-to-end — from data collection through report preparation. Result: standardized, auditable processes across risk, treasury, and reporting functions.

FINANCE, PAYMENTS & PROCUREMENT

I know about budgeting and sub-accounts..

- EY, for a major Ukrainian bank (2025) - improve procurement and budget-control processes, where licenses and software fees made up over 70% of total opex. I audited the existing controls and designed a digital asset management system (request → justification → tender → allocation, with end-user and vendor-communication tracking), plus a category management approach. Result: sponsored by the bank's advisory board, though the engagement didn't reach the implementation phase.
- Tribute Technologies - designed the cost/revenue breakdown logic for a multi-party network of proxy parties and commission schemas, modeling who gets paid what whenever a customer pays for flowers. Result: a working, transparent commission calculation system.
- Goal - give Kernel an independent way to verify subcontractor and machinery invoices across a complex rented-fleet interpayment structure. I connected multiple production systems and applied coefficients to calculate the true cost of field operations. Result: an independent cost-verification control used to check supplier invoices.
- Ministry of Finance / World Bank - goal was to select a vendor for an ERP that automates the whole budgetary system of Ukraine. I designed Treasury processes and automated flows for Ukraine's national budget system (school → Parliament level). Result: integrator selected to build the system.
- Ferrexpo, a mining complex in Kremenchuk, Ukraine - goal was to improve budgeting and resource planning and align investment management with supply chain and procurement processes. I mapped the full capital-investment lifecycle: estimation, budgeting, vendor selection, budget corrections, plan tracking, KPIs, payments, forecasting and approval. Result: delivered process maps, budget-sheet prototypes, and functional requirements for automation.
